Title : On the conformance to a rule of seepage losses from seasonally operated canals

Periodical : Izv. AN SSSR. Otd. tekh. nauk 7, 146-150, 1947

Abstract : Establishes and gives approximate analytical expression to a rule for seepage losses from seasonally operated canals, as for example, irrigation canals with an anti-seepage lining. Diagrams. One reference.

152. Thunderstorms in Central Asia. M. D. Gleizer. *Elektr. Stantsii*, 1953, *No.* 5, 42–4. *In Russian.*

The results of long-term observations of lightning flashes in Central Asia show that the frequency of occurrence, and to some degree, the intensity of the flashes increase with the altitude. The frequency of occurrence depends also on the longitude, increasing from west to east. The number of thunderstorm days in a year varies from 5 to 40 for different regions, and for the most of the country is between 10 and 30. The thunderstorm seasons are spring and autumn. A short survey is included of the outages and damage caused by lightning in the last six years to various 35 and 110 kV transmission lines.

AUTHOR: Glayzer, V.L.

TITLE: The question of preserving Natural Resources in the Moscow Coal Basin in connection with [illegible] (O sokhranenii [illegible] v Moskovskom ugol'nom basseyne)

PERIODICAL: Sovetskaya [illegible], 1958, Nr 7, pp 11-19 (USSR)

ABSTRACT: Many years ago, the volumetric weight of the coal in the seams of coalfields of the Moscow region was fixed at 1.3 tons/cubic m. Since then, better quality coal was extracted, the ash content of lower quality coal increased from 25% to 30.2%, but the volumetric weight still remained unchanged. In 1952-53, the VNIMI devised the following formula for fixing this weight (R_m)

$$R_m = 1.05 + 0.01A^c$$

with A^c being the ash content of absolutely dry coal in %. With the increase of the ash content the volumetric weight of the coal in the seam should have been increased from 1.3 to 1.35 tons cubic m with a deviation from 1.33 to 1.45. Computations based on the old volumetric weight lead to an artificial reduction of coal losses. The author proposed

Card 1/2

[illegible]-132-58-6-[illegible]/26

The Question of Preserving Natural Resources in the Moscow Coal Basin

a slight alteration in the above mentioned formula:

$$h_m = 1.0[illegible] + [illegible]$$

In general, the author found that only [illegible] of the coal reserves of the Moscow region are being exploited. There are 2 tables.

TITLE: Modernization of Machine Tools in the Moscow Brake Plant (Modernizatsiya stankov na Moskovskom tormoznom zavode)

PERIODICAL: Vashinostroitel', 1958, Nr 8, pp 10-15 (USSR)

ABSTRACT: In the Moscow Brake Plant the turning and screw-cutting lathe Ye-3 (year of production 1940) is used. This lathe has been modernized by increasing the revolutions of the drive shaft from 895 to 970 per min. The spindle bearing has been replaced by a radial roller bearing permitting a speed of 2,500 rpm. Jet lubrication by means of a plunger pump has been installed in the speed gear. The power of the electric motor has been increased from 4.5 kw to 7.0 kw. The productivity of the modernized lathe is 25-30% higher than the old one. The turning and screw-cutting lathe in Figure 2 (year of production 1940) has been transformed into a special lathe for the machining of parts which can not be treated with abrasives. The lathe has been fitted with bearings for pressures of 350 kg at 3,000 rpm. A new lubrication pump and worm gear have been installed. The productivity of the lathe increased by 3[illegible]. The horizontal milling lathe (year of production 1940) has been improved by the installation of an additional milling head. The turning

Modernization of Machine Tools in the Moscow Brake Plant [illegible]

speed of the spindle is 1,500, 2,860, or 5,000 rpm. The productivity of the lathe has been increased more than two times. The cylinder-and-cone grinding machine (year of production 1930) has been fitted with a new front mandrel, with individual electromotors, etc. The mandrel permits grinding with a speed of 155-400 rpm. The productivity of the machine has been increased 30 %. The turning turret lathe (year of production 1949) has been improved by the installation of a 10 kw electromotor, and by the replacement of a flat-belt transmission by a V-belt transmission. The speed of the spindle is 650 rpm. The productivity of the lathe has been increased two times and the auxiliary time needed has been reduced by 27 %.

Remont i modernizatsiya stanochnogo oborudovaniya; sbornik statey. Moscow, Mashgiz, 1960.
151 p. Errata slip inserted. 6,100 copies printed.

Ed. (Title page): N.A. Rozanin, Candidate of Technical Sciences; Ed. (Inside book): A.T. Popov, Engineer; Tech. Ed.: V.D. Mikhaylova; Managing Ed. for Literature on Metalworking and Machine-Tool Construction (Mashgiz): N.D. Kapustinar, Engineer; Editorial Board: N.A. Rozanin (Chairman), Candidate of Technical Sciences; Yu.B. Borisov, Engineer; V.D. Fletnev, Engineer; V.I. Mikhaylovskiy, Engineer; and V.P. Solov, Engineer.

PURPOSE: This collection of articles is intended for technical personnel dealing with modernization and overhaul of equipment.

COVERAGE: The articles in this collection deal with the basic trends and a number of specific problems in the modernization of the machine industry. Modernization of foundry, forging-shop, and crane equipment and problems in the automation of equipment repair are discussed. Information is given on the use of utilized

TITLE: Metal-Ceramic Bushings

PERIODICAL: Mashinostroitel', 1960, No 1, p. 29

TEXT. Tests which were carried out at the TsNIITMASh and various plants (e. g. at the Kirov Plant in Leningrad, Novokramatorskiy Plant in Kramatorsk and others) show that metal-ceramic materials are the best substitutes for bronze in the manufacture of bushings, since they possess high antifriction properties and their manufacturing process is not complicated Metal-ceramic bushings can undergo mechanical treatment: turning, milling, drilling and threading operations. Lathe work should be carried out at high cutting speeds and small feeds with 0.05 - 0 01 mm depth of cut. The authors point out that starting in 1953, the Moskovskiy tormoznoy zavod (Moscow Brake Plant) has been using metal-ceramics in various units of metal-cutting, metal-pressing and foundry machinery. In order to protect metal-ceramic parts from corrosion they should be impregnated with oil and covered with a paraffin layer. Preserved in such a way, they can be stored at temperatures in the range of 8-30°C up to one year. It is emphasized that special attention has to be given to the co-axiality of the

Card 1/2

Metal-Ceramic Bushings S/117/60/000/001/005/005

fitting seat of the bushing, since skewing reduces the durability of bushings considerably. Operational tests showed that metal-ceramics may well replace the "ОЦС6-6-3" (OTsS6-6-3) tin bronze in the manufacture of bushings, if there are no impact loads, and in some cases they may even substitute bronze in antifriction bushings.
